

What's new

Everything delivered between Monday 28 September and Saturday 3 October 2026, where each part runs, and what comes next.

COVERS	28 September 2026 to 3 October 2026
WRITTEN FOR	Owners, office admins, fleet managers, revenue clerks and the project team
BUILT TO	The XCODE Web and XCODE Mobile designs (Web v2.8) and their build notes

You do not need any technical background to read this. Every change is described by what you will see on screen and what it means for your work. Where a change affects what you are allowed to do, that is said plainly.

Each item is marked with where it was delivered:

- API** The server behind every screen. It keeps the records, applies the rules and checks every action, whichever screen it comes from.
- WEB** XCODE Web, used in a browser on a computer or tablet.
- MOBILE** XCODE Mobile, the phone app for Android and iPhone.

Some things described here may be hidden for you. What you can see and do depends on the role and permissions your admin gave you.

1 Summary

The third phase of XCODE is in place. Money coming in is now recorded for each vehicle, day by day, on the web and on the phone, and each vehicle's report shows what it earned against what it cost.

Revenue is recorded, one day at a time API WEB MOBILE

A week grid for the whole fleet on the web, a day at a time on the phone, and one entry for each vehicle on each day. A day with no earnings is recorded with a reason, so a gap is never left to guesswork.

The phone captures without internet API MOBILE

Entries are kept on the phone and sent when a connection returns, oldest first. An entry leaves the phone only once the server has it.

Costs are picked from a catalog API WEB

Expense categories and items, each counting as repairs and maintenance, recurring charges or loan repayments. Scheduled items now run every week, every month or every year.

Money put into a vehicle is recorded API WEB

What was spent before and around buying a vehicle, and how much of it has come back from what the vehicle has since contributed.

Each vehicle's report shows what is left API WEB

Money in, money out in its three buckets, net contribution, savings set aside and the figure after savings, for this week or this month.

The dashboard carries real figures API WEB MOBILE

The cards that were showing zero now show what has been recorded, each one following its own permission, on the web and on the phone.

The organization decides what "today" is API WEB MOBILE

Every screen takes today from the organization's own business date rather than from the computer's clock, so a fleet closing its day late still reports against the right day.

What was delivered, and where

Every module delivered in the period, and the platforms it runs on.

MODULE	API	WEB	MOBILE
Revenue capture, day by day	Delivered	Delivered	Delivered works offline
The revenue week grid	Delivered	Delivered	Delivered a day at a time
A vehicle's week in detail	Delivered	Delivered	Delivered
Correcting a day after it has passed	Delivered	Delivered	Delivered
Expense categories and items	Delivered	Delivered	On the web
Scheduled expenses and savings	Delivered	Delivered	On the web
Money put into a vehicle	Delivered	Delivered	On the web
The vehicle report	Delivered	Delivered	On the web
Dashboard cards on live figures	Delivered	Delivered	Delivered
The organization's business date	Delivered	Delivered	Applied set on the web
Change log with before and after	Delivered	Delivered	On the web
People and access	Delivered	Delivered	View only your own access
Petty cash and office bills	Next	Next	Next
Reports	Next	Next	Next

Setup is done on the web by design. The phone's More menu lists the setup areas a person can use, marked "On XCODE Web".

2 Recording revenue

Money coming in is now recorded for each vehicle, one day at a time, on the web and on the phone.

EVERYONE

One entry for each vehicle, each day API WEB MOBILE

A day holds either an amount or a reason why there were no earnings. The reasons are Garage, Arrest, No Crew and Other, and the screen asks what happened in up to 80 characters. Recording a day with no earnings is its own permission.

Days are filled in order API WEB MOBILE

The earliest missing day comes first. A later day cannot be entered while an earlier one is still empty, and the screen names the day that is waiting. That day comes from everything ever recorded for the vehicle, not only the week on screen.

Amounts API WEB MOBILE

An amount is more than zero and has at most two decimals. Money shows in the organization's currency, and where it is not a whole figure its decimals show in full, for example KES 1,500.50.

Changing a day API WEB MOBILE

A change made on the same day is simply an update. Changing a day once it has passed needs the "Correct revenue after the day" permission, and the record is marked as edited after capture, which the dashboard counts.

Two people at the same moment API WEB MOBILE

If someone else saved that day first, the screen says so and shows both the saved value and yours. You choose **Keep saved value** or **Replace with mine**. Nothing is overwritten without being seen.

WHY THIS MATTERS

Repeating the same entry changes nothing and reports the record that is already there. A phone that sends an entry twice, or a clerk who taps save twice, never creates a second record for that day.

Recording revenue, continued

ON THE WEB

The week grid WEB

Every vehicle down the side and the seven days across the top, for a week starting on whichever day the organization chose. It can be filtered to one PSV company or one vehicle, and shows what has come in so far against what was expected. You can move back through past weeks, but not past the current one.

A vehicle's week in detail WEB

Expected, actual and the difference, with a bar for each day against that day's share of the weekly target.

Capture WEB

One vehicle and one day at a time. After a save the screen moves to the next vehicle still missing that day, so a week is filled without hunting for the gaps.

ON THE PHONE

Week, day, then capture MOBILE

The Revenue tab opens on the week, then the day, then the capture sheet. A past day or week with no vehicle in service says "No vehicles on this day" or "No vehicles this week", rather than looking like an empty screen.

What each person may do API WEB MOBILE

Viewing revenue, capturing it, recording a day with no earnings and correcting a day after it has passed are four separate permissions. Someone without viewing access is told that their admin has not granted it, rather than being shown an empty week.

3 The phone app

XCODE Mobile now captures revenue in the field, and keeps working where there is no connection.

EVERYONE

Capture without internet API MOBILE

An entry is written to the phone first and sent when a connection returns. The screen says "No internet. They are sent when you are back online.", and each waiting entry is marked **Not sent yet**. Entries are sent oldest first for each vehicle, so the order the days were captured in is kept.

Nothing is lost MOBILE

An entry leaves the phone only when the server has accepted it, or when the person discards it themselves. If the app closed in the middle of saving one, the phone finds it on the next start and asks for that day to be captured again, rather than losing it quietly.

Entries belong to the person, not the phone MOBILE

Waiting entries are kept against the person who captured them. A changed mobile number, or someone else signing in on the same phone, no longer strands them.

When someone else saved first API MOBILE

The phone keeps the entry, says someone else saved this day first, and offers the same choice as the web: keep what was saved, or replace it with yours.

WHY THIS MATTERS

The phone is where revenue is captured, often out of signal. An entry that quietly disappeared would be money missing from every report that follows, so the phone holds each one until the server has confirmed it.

ON THE PHONE

Unlocking follows the organization's policy API MOBILE

Wrong PIN tries made without a connection now use the organization's own number of tries and its pause length, kept with the person, so an offline phone behaves exactly as the web does.

A PIN that no longer works API MOBILE

If the server refuses an unlock that this phone would itself have accepted, the phone says it can no longer unlock with that PIN and asks the person to sign in again. It is not counted as a wrong try, so nobody is paused for a change made elsewhere.

Home API MOBILE

The cards now carry real figures for the period chosen, each one following its own permission. Where nothing is permitted the screen still says "Nothing to show yet" rather than showing an empty frame.

Switching user MOBILE

Switching user tells the person how many entries are still waiting to be sent and whose they are. Nothing is discarded on their behalf.

4 Expenses, savings and money put in

Costs are now picked from a catalog the organization keeps, scheduled items run weekly, monthly or yearly, and what was put into a vehicle is recorded against it.

OFFICE ADMINS AND FLEET MANAGERS

Expense categories and items API WEB

Categories group what money is spent on, and each category counts as one of three things: **Repairs and maintenance**, **Recurring charges** or **Loan repayments**. Inside a category sit the items people pick when they record an expense.

- Names are unique and up to 100 characters: a category within the organization, an item within its category.
- Nothing is deleted. A category or item is turned off and can be turned back on. One turned off ahead of time shows "Turns off on ..." until that date, and can still be cancelled.
- A new organization starts with the catalog already filled in, for example Spares, Tyres and Towing under garage and repairs; Parking, SACCO fee, Insurance and Inspection under charges; and Loan repayment under loans.

Scheduled expenses and savings API WEB

What the last report called recurring costs and savings is now called scheduled expenses and savings, on screen and in the change log.

- An item posts **every week**, **every month** or **every year**. Every day is no longer offered for new items; items already running daily keep posting as they were.
- A cost picks an expense item, which decides both its name and which of the three buckets it counts in. A saving is named instead, and may only be set aside weekly or monthly.
- A yearly item picks a month and a day from 1 to 28, or the last day of the month, so that short months are covered.
- A note of up to 200 characters can be kept with the item.
- A new item cannot start earlier than the first day of the month the business date falls in, so weeks already closed are not rewritten.
- The amount is split across the chosen vehicles and must add up to the total exactly. An even split is worked out to the cent.
- Stopping an item still asks for a typed reason. A stop dated ahead shows as "Stops ..." and can be cancelled; a stop already in effect is final.

OWNERS AND FLEET MANAGERS

Money put into a vehicle API WEB

Each vehicle has an Investment tab for money put in before and around buying it, each entry with a date, what it was and an amount. It is never counted as money out.

Back so far and **Paid back** appear once they can be worked out from the revenue records: what the vehicle has contributed since it joined the fleet, and that as a share of what was put into it.

5 What each vehicle earns

With revenue recorded and costs categorised, the vehicle report and the dashboard show real figures instead of zeros.

OFFICE ADMINS AND FLEET MANAGERS

The vehicle report API WEB

For this week or this month, worked out from the organization's own business date:

- **Money in**, from the revenue records.
- **Money out**, split into repairs and maintenance, recurring charges and loan repayments.
- **Net contribution**, which is money in less money out.
- **Savings set aside**, shown separately from costs, and the figure **after savings**.

Money in and money out are counted on the day they moved. Fuel and crew pay are not tracked, and the screen says so rather than leaving the reader to assume they are included.

Investment payback API WEB

What a vehicle has contributed since it joined the fleet is set against what was put into it, as an amount and as a percentage.

EVERYONE

The dashboard API WEB MOBILE

Today's revenue, net contribution, money out, missing revenue days, records edited after capture and money invested all carry figures. The period switch names the dates it covers, for example "This week, 28 Sep to 4 Oct 2026", so nobody has to work out which days are in view.

Each card follows its own permission. Two people signed in side by side will see a different set, and the cards are the same on the web and on the phone.

Missing revenue days API WEB MOBILE

Counted only from the day a vehicle joined the fleet, and only for the days it was in service. With nothing outstanding the card says "Every vehicle has a record for every day".

FIGURES ON THE CARDS

The cards for petty cash, office bills and yearly commitments still say they are not connected yet. They will carry figures when those parts are built. No card ever shows a made-up number.

6 People and access

Roles now match the design exactly, and a person's details are shown only as far as the viewer's own access reaches.

OWNERS AND OFFICE ADMINS

Roles follow the design API

The permissions each role starts with now match the XCODE Web design. An Owner holds everything except "See today's capture for my vehicles". An Office admin no longer holds that, nor investment, revenue capture, no-earnings reasons or approving bills. Single permissions can still be added to anyone who needs them.

Who may give which role API WEB

A person may give only a role whose standard permissions they already hold themselves, and only an Owner may give Owner. Where none can be given, the screen says so rather than offering a list that will be refused on save.

WHY THIS MATTERS

Together with the rule below on sign-in details, this separates duties. An Office admin can no longer give out the Revenue clerk or Fleet manager role, nor change those people's email or mobile number, so whoever corrects revenue cannot also create or take over the account that captures it. An Owner does both.

People you can only partly see API WEB

A person's companies and vehicles are listed only where the viewer can reach them, and the rest are counted instead, for example "3 companies (2 hidden)". Saving that person leaves the assignments you cannot see untouched.

Changing an email or mobile number API

Only an Owner, or someone who can see that person's whole view, may change the details they sign in with. It still signs them out everywhere, and their next sign-in needs a code sent to the new address. Their PIN is kept.

One source for each role's permissions API

A role's standard permissions now come from one list, used both for what is shown on screen and for what is allowed when a request arrives. The two can no longer drift apart.

EVERYONE

Your access API WEB MOBILE

Anyone can see their own role and permissions, grouped by area, together with what they are allowed to see. On the web it is in the menu under your name; on the phone it is under More.

7 Setting up the fleet

The fleet now has its own idea of today, vehicles can leave it, and every change is written down in full.

OWNERS AND OFFICE ADMINS

The organization's business date API WEB

An organization sets the date it is working to, and every screen takes "today" from it rather than from the computer's clock. Left empty, it follows the organization's own time zone. This decides which week and month a report covers, which day a capture belongs to, and what counts as a past day.

A vehicle leaving the fleet API WEB

A vehicle now has a date it leaves as well as the date it joined. Leaving stops its weekly targets, its share of scheduled items and future report postings from that date. Reports for past weeks keep it, exactly as they were. Missing revenue days are counted only from the date it joined.

Archiving a PSV company API WEB

A company can be archived once its vehicles have left the fleet. An archive dated ahead shows as "Archives on ..." and can be cancelled right up to that date.

Reasons for changes API WEB

The change log now fills in its own reason, naming the record and what changed, for example renaming a company or changing the amount of a scheduled item. A typed reason is asked for in two places only: stopping a scheduled item, and removing someone's access.

OWNERS, OFFICE ADMINS AND AUDITORS

The change log API WEB

Who changed what and when, with each value before and after the change, across PSV companies, vehicles, scheduled expenses and savings, expense categories, investment, organization settings, the business date, and people and access. It loads a page at a time, with Load more, rather than fetching everything at once.

The people section carries contact details and permissions, so it is shown only to those who may view people.

WHY THIS MATTERS

Targets, scheduled items and revenue records are kept as history, never overwritten. A vehicle that leaves, an item that stops and an amount that changes all keep the date they took effect, so a report run twice for the same past week gives the same answer both times.

8 The web app

XCODE Web was made lighter and harder to misuse, without changing how it looks.

EVERYONE

Pages load faster WEB

Each screen is now fetched the first time it is opened, instead of every screen arriving at sign-in. That took roughly a sixth off what the browser has to download before the first page appears.

A page that fails to load WEB

A screen that cannot be fetched, usually on a poor connection, shows what happened and a retry, instead of a blank page.

Amounts and dates WEB MOBILE

Money follows the organization's currency and its chosen decimals, and dates follow its format and time zone, on every screen and on the phone.

PROTECTIONS IN THE BROWSER

What the browser is told WEB

- Browsers are told to keep to a secure connection, and pages cannot be placed inside another site.
- Camera, microphone and location are switched off for the app.
- The server does not announce what it is built on.

Limits that cannot be talked around API WEB

- Each signed-in person is limited separately, and only the address the server itself recorded is trusted for that, so a browser cannot choose which limit it falls under.
- A save larger than a megabyte is refused before it is read.
- When the server cannot be reached, the page says the service is unavailable rather than failing with an unexplained error.

WHY THIS MATTERS

Most of these are invisible when everything is working. They matter on the day something is not: a slow network, a page left open overnight, or someone trying the app from outside the organization.

9 Where the build plan stands

Measured against the phases in the XCODE build notes and their addendum.

PHASE	MODULES	STATUS	WHERE IT STANDS
1	Sign in, unlock, app shell, people and access	DELIVERED	On the API, the web and the phone. Roles now match the design, and each person's view is limited to what they may reach.
2	PSV companies, vehicles, scheduled expenses and savings, expense catalog, investment, change log	DELIVERED	Complete. The expense catalog, yearly items, money put into a vehicle, the business date and a change log showing before and after were all added in this period.
3	Revenue: week grid, vehicle week detail, capture, day and week lists, offline capture on the phone	DELIVERED	On the API, the web and the phone. The dashboard cards now carry its figures, and the vehicle report sets them against costs.
4	Petty cash and office bills	NEXT	The permissions exist and the phone's Spend tab appears for the right people, listing what they will be able to do there. The screens are the next piece of work.
5	Reports	NEXT	Not started. The vehicle report and the dashboard cover what is needed in the meantime.

Still to come

- **Updates straight to the phones.** Every change still needs a new app build installed on each phone.
- **A time limit on unlocking offline.** A trusted phone unlocks without a connection and with no limit. It will ask the person to connect once every 72 hours; entries waiting to be sent are kept either way.
- **Capture after an offline start.** A phone opened without a connection, and without having loaded first, cannot yet offer capture. It will keep a short list of vehicles and the days they can be captured for, with no amounts or totals held on the phone.
- **A dark theme on the phone.** The organization can choose a theme; the phone does not yet follow it.
- **The weekly target hint.** Still says "Monday to Sunday", whatever first day of the week the organization chose.
- **Naming the field.** A refused locale or security setting says the section is invalid without saying which field caused it.

10 Points settled since the last report

The five points left open at the end of the last period have been settled, each on the merits of the spec, the records and what is safe.

When a vehicle leaves the fleet

Settled. A vehicle gets a date it leaves. Targets, scheduled shares and future postings stop from that date, and reports for past weeks keep the vehicle exactly as they were. A PSV company can be archived once its vehicles have gone. A leave date that would hide a day already recorded is refused, naming the day.

How far back a scheduled item can start

Settled. No earlier than the first day of the month the business date falls in, both on a new item and when a start date is changed. Weeks already closed cannot be rewritten from behind.

The lowest setting for wrong PINs

Settled. Between 3 and 10 wrong tries, and a pause between 1 and 60 minutes. A setting stored outside that range is brought back inside it, so nobody can be locked out for a day by a single wrong try.

Which roles each role may give

Settled. Only a role whose standard permissions the giver already holds, and only an Owner may give Owner. The web offers only the roles that person can actually give.

Reasons for changes

Settled. The automatic reason stays, and now names the record and what changed. A typed reason is asked for only when stopping a scheduled item and when removing access, where the reason is genuinely worth reading later.

Other points from the last report

- **Seeing what a change was.** The change log now shows each value before and after, side by side.
- **Scoped admins editing people who reach further.** A person's companies and vehicles show only as far as the viewer reaches, the rest are counted, and saving leaves them untouched instead of refusing.
- **One source for each role's permissions.** Role defaults now come from a single list, used both on screen and when a request is checked.
- **Today's date.** Every screen takes today from the organization's business date, not the computer's clock.
- **Add company.** Offered only to editors who can act across the whole organization.

11 Points to settle

These need a decision before the work can sensibly start.

The largest a single entry may be

A day's revenue has no upper limit today, so a mistyped figure can be saved and then carries through the dashboard and every report that follows. It can be corrected, but only by someone with the permission to change a past day. Should there be a cap, and at what figure?

Showing a percentage that is out of scale

A record far larger than the target produces a percentage in the millions. The figure is kept inside a safe range, but the screen still shows it as it is. Should it read "over 100%" beyond some point, or show the amount instead?

Updating the phones

The app has no way to update itself, so every change needs a new build installed on each phone. Turning updates on needs the organization's own developer account, and is best done with the next build rather than after it.

The old cost categories

Running costs, crew costs and fixed commitments all count as recurring charges, and repairs and upkeep as repairs and maintenance. None of the old categories was a loan, so none maps to loan repayments. Owners move an item by picking an expense item the next time they edit it. Is that the right mapping?

Fuel and crew pay

Neither is tracked, and the vehicle report says so plainly. Should they become expense items like any other cost, or stay outside XCODE because they are settled daily by the crew?

This guide covers 28 September 2026 to 3 October 2026 and describes XCODE as it stands at the end of that period. Chapter 10 answers the points the last report left open, and chapter 9 sets out what is still to come.
