

XCODE build notes: addendum 1

What changed in the design since v0.9, and the next three pieces of work: access, revenue, petty cash

UI file	Version	Note
XCODE Web.html	2.8	Build against this, not the v0.9 designs
XCODE Mobile.html	2.5	Same

Phases 1 and 2 are delivered and accepted. This addendum corrects what the design changed underneath them, settles the open decisions, and sets the next brief.

1. Corrections to phases 1 and 2

Area	What was built	What it should be
Cost categories	Running costs, repairs and upkeep, crew costs, fixed commitments	Three buckets only: repairs and maintenance, recurring charges, loan repayments. Fuel and crew pay are not tracked anywhere
Expense items	None	New setup module: expense categories, each holding items. Items are what people pick on every expense and every petty cash entry
Scheduled items	Daily, weekly, monthly	Weekly, monthly, yearly on a month and day. Daily is gone. Savings are weekly or monthly only. The item picks an expense item, not a free name, and carries an optional note
Naming	Recurring costs and savings	Scheduled expenses and savings
Vehicle report	Four category figures	Money in, target, the three buckets, money out, net contribution, savings set aside, after savings
Investment	Not in scope	New tab on each vehicle: what went in, what has come back, percentage paid off. Never counted as money out. Two permissions
Petty cash	Not built	Fully designed. See section 4
Reports	Not in scope	Fully designed. See section 5

2. Decisions settled

Question	Decision
When a vehicle leaves the fleet	Add a "left the fleet" date. It ends the weekly target, stops that vehicle's share of scheduled items and removes it from pickers. It stays in every past report. Companies are archived, never deleted
How far back a scheduled item can start	No earlier than the first of the current month. Anything older is a one off expense, not a schedule
Lowest setting for wrong PINs	Minimum three tries. The pause is capped at one hour. A reset by email still lifts it
Which roles each role may give	A person may only give a role whose permissions all sit inside their own. Only an Owner may give Owner
Reasons for changes	Keep the automatic reason. Ask for a typed reason in four places only: removing access, deleting a petty cash entry, sending an entry back, stopping a scheduled item

3. Access, permissions and authentication: finish first

Everything else sits on these, so they come before revenue.

Item	What to do	Priority
One source for role permissions	Each role's standard permissions are held in two places. Two lists that can drift is a live access risk. Keep one list	1
Change log	Show what a change was before and after, side by side	2
Business date	Every screen takes today from the organization's business date, never the computer clock	3
Scoped admin saving a wider person	Refusing is right. Say why, and leave the companies outside their view untouched	4
Role granting	Enforce the rule in section 2	5
Wrong PIN policy	Minimum three tries, pause capped at one hour	5
Typed reasons	The four places listed in section 2	5

New permissions to add

- See what was invested in a vehicle, and record what was invested.
- View expenses, record an expense straight onto a vehicle, change an expense after the day.
- Set up expense categories and items.
- Petty cash: record spending from my float, view every float, approve single entries, approve a whole day, give cash to a float, let a float go below zero. All separate, all checked on the server.

4. Phase 3: Revenue

Screen	Web	Mobile
Week grid: vehicles down, Monday to Sunday across, week total, percentage of expected	Yes	
Vehicle week detail: expected, actual, difference and a bar for each day	Yes	Yes
Day list with one tap capture		Yes
Capture: an amount, or a reason	Yes	Yes

Rules

- One record per vehicle per day: an amount, or a reason from Garage, Arrest, No Crew and Other. Other needs a short description.
- A missing day must be filled before a later one for that vehicle. The screen opens the earliest missing day first.
- After saving, move to the next vehicle still missing that day.
- Expected per day is the weekly target that applied on that day, divided by 7. Targets are dated.
- Not counted as a shortfall: future days, days before the vehicle joined the fleet, and today before capture.
- Changing a past day needs "Correct revenue after the day" and is recorded as an edit.
- The phone captures offline and syncs when a connection returns. No entry is ever lost.

5. Phase 4: Petty cash

Its own menu item, not under Spend. Four figures at the top for the selected day: opening cash balance, money out, cash received, closing cash balance. Expenses and Cash received sit beside them as tabs. One row holds the day arrows, manager, status, search and the buttons Expense, Cash, Credit note and Approve day.

Rules

- One float per manager. Cash in hand is cash given, less cash returned, less everything recorded against it, approved or not.
- An expense names a vehicle, an expense item, units and amount each. It sits as Waiting.
- Approving posts it to the vehicle. Only approved entries reach a vehicle report.
- Sending an entry back needs a comment, which stays on the entry until the manager fixes it.
- A credit note is cash handed back to the office. It lowers cash received and the float, needs a reason, and never touches a vehicle.
- Spending more than the float holds is refused unless the person may take a float below zero.
- Approval limits are per entry, and they apply to approving a whole day too.
- Any line can be edited or deleted by the person who recorded it while it is not approved, and by anyone who can approve at any time. Editing an approved line returns it to Waiting.
- The phone carries the manager side: my float, record spending, add a credit note, see what was sent back. Approving stays on the web.

6. Reports, once revenue exists

Any date range, filtered by company and vehicle, on three tabs.

- Summary: money in against target, money out split into the three buckets with each share, net contribution, savings set aside, and what is left after savings.
- By vehicle: money in, the three buckets, money out, net and savings, ranked by net, with a total row.
- By category: each category with its total and share of money out, then every item inside it with how many postings and how much.
- All three read the same records: scheduled items on their due dates, approved petty cash, and expenses recorded straight onto a vehicle. Nothing is counted twice.

7. Sequence

Order	Work
1	Access fixes in section 3, starting with one source for role permissions
2	Revenue, web and phone
3	Petty cash, web and the manager side on the phone
4	Connect the dashboard cards and build Reports

Until revenue exists, keep the dashboard behind a "connect revenue first" state rather than showing a screen of zeros to anyone outside the project team.
