

These notes cover only what changed after the last handover (Web v2.16, Mobile v2.8). The clickable prototype is the reference for screens; this page is the reference for rules the screens cannot show. Colours and type in the Brand v3.1 token sheet still stand. Its Layout section is replaced by section 3 here.

1. Data rules

TOPIC	WHAT THE DEVELOPER MUST BUILD
One transaction, one vehicle	Every expense row holds exactly one vehicle. A purchase shared by several vehicles is captured once in the form, then saved as one transaction per vehicle. Keep a group reference on each (grp, count, group total) plus the true unit cost and quantity share, so price reports are not distorted. Each row is approved, rejected and reopened on its own.
Three sources, one ledger	Central expenses is the ledger of record. Rows carry src: central (added there by a person with the right), pc (a petty cash entry, present only while approved; reopening removes it), sched (posted by a schedule). Only central rows are editable in the ledger.
Scheduled expenses are standing orders	A schedule posts in full on its run date and never before. Post one row per vehicle. Make the job safe to run twice: unique on schedule, run date and vehicle. Editing or pausing a schedule never changes rows already posted; changes apply from the next run. Weekly figures are therefore lumpy by design. Frequencies: weekly, monthly, yearly; savings also daily.
Savings rule	A saving may carry cond {min, days} with days 1, 7 or 30: the vehicle saves only if its own revenue over the days ending on the run date is at least min. Each run and vehicle has a state: saved, skipped or held. A run is held until every day in its window has a revenue record. A day with a no revenue reason counts as zero. Once decided a run is final. After any revenue save, decide the held runs again.
Savings opening balance	Optional open {date, amounts per vehicle} for balances migrated from another system. Balance = opening amount + saved runs dated after the opening date. Runs on or before that date are ignored in the balance.
Petty cash	Cash balance = Opening balance + Cash issued - Expenses - Credit notes. A credit note reduces cash on hand and sits under Cash received. Issuing cash needs no reason; a credit note does. Waiting entries already reduce the balance; rejected ones do not. Any period can be shown: opening is at the start of the first day, closing at the end of the last.
Periods	One model everywhere: {from, to, unit} with unit day, week, four weeks, month or custom. Previous and next move by the unit. Presets: Today, Yesterday, This week, Last week, Last 4 weeks, This month, Last month. Weekly targets are pro rated by days for other lengths.

2. Access

TOPIC	WHAT THE DEVELOPER MUST BUILD
46 rights in 11 modules	Dashboard 3, Revenue 4, Central expenses 4, Petty cash 13, Scheduled expenses 4, Reports 3, PSV companies 3, Vehicles 3, Expense items 4, People and access 4, Change log 1. The full list with keys is the MODS array in the prototype source. View, add, edit, approve, reject, pause, block and export are separate rights. Export is granted per module.
View comes first	Each module has one view right (base). Granting any action grants view; removing view removes the module's other rights. A person cannot remove their own right to edit people.
Vehicle visibility	Each person has regs: all, or a list of vehicles. Apply it on the server to every query, total, report, form picker and export. Do not rely on the screen to hide rows.
Edge cases decided	A float balance is always shown whole; rows on vehicles the person cannot see are hidden and counted in the table footer. A person with limited vehicles can change a schedule only if all its vehicles are theirs, and can grant only vehicles they can see.

3. Web layout rules

TOPIC	RULE
Forms	Every form is a pop up: expenses, spending, schedules, savings, people, capture revenue, Setup edits. The only exception is the revenue grid, which edits in the row.
No top bar	Company filter and sign out live under the profile button, top right. When a company is selected its name shows on the button. "Viewing as" and opening without a PIN are review aids in the prototype only: do not ship them.
One date control	Previous arrow, date, next arrow, always first on the coloured bar. Clicking the date opens the preset list and custom From and To. Custom dates use day, month and year lists so the order is always day month year.
Widths	The coloured bar and every table span the full width of the white sheet. One side margin, <code>clamp(16px, 1.7vw, 28px)</code> , is shared by the bar contents, page title, toolbar and the first and last table columns.
What sits on the bar	Central expenses and Revenue: figures, then source, search and Export. Petty cash: date, the balance sum, the action button and profile, with no page title. When petty cash shows more than one day, rows are grouped under a day row with that day's total.

4. Exports

TOPIC	RULE
Scope	Excel and PDF of the table on screen, as filtered, from Petty cash, Central expenses, Revenue and Reports. Write every export to the change log.
Build it on the server	The prototype builds both files in the browser with no libraries, only to show the result. In production generate them on the server and embed Figtree and Fraunces. PDF layout to copy: A4 landscape, brand header with logo, headline card and figure tiles, banded rows, chips for status and source, bars beside percentages, tinted totals row, footer with page numbers. Excel: numbers as numbers, frozen header row, totals row.

5. Not built yet

ITEM	NOTE
Mobile	XCODE Mobile v2.11 still has the old rights, no vehicle visibility, and saves a shared purchase as one combined entry. It needs the rules in sections 1 and 2.
Gaps to plan for	Schedules have no end date (a loan would post forever). Money cannot yet be taken out of a saving. There is no approval limit by amount. Offline queue and sync is assumed but not prototyped.
Prototype limits	All data is sample data held in the page and resets on reload. Today is fixed at 9 October 2026.
